

MODEL E Product Summary

The Model E is more than just an innovative storage device to maximize your existing garage space. It removes the need to lift items in and out of shelving or storing them on a wall hook device. Finally, you can store items out of the way and still access them in seconds. In addition to these features you can customize the look and appearance of the device to bring style and appearance to an otherwise plain space.

Stow High is a simple no fuss, DIY solution for your garage or home storage needs all in the one device. Installation typically takes less than 2 hours. It is ready to be plugged into any domestic power point. Once plugged in and installed use the remote-control unit to operate it. The battery powered remote control can be placed anywhere within the garage for convenience.

Fabricated from metal, Stow High is designed to be robust and to last. Treated in a galvanised or powder coated finish provides protection and durability. You will be confident knowing the Model E has undergone and passed rigorous design and testing protocols and achieves compliance to Australian Standards. A Model E can be installed into timber stud walls, brickwork, blockwork and concrete structures. It is certified to carry (lift and lower) 40 kg's of additional weight, which is the equivalent of 40 litres of water or around ½ the weight of an average adult!

Lifting and lowering typically takes less than 20 seconds regardless of the weight at the single push of a button. Push down on the remote and it automatically lowers and stops at the 'low' level. Access what you need then push up on the remote and it raises automatically and closes at the 'high' level. These settings are pre-programmed from the factory, so you don't need to worry about setting them up all you need to do is plug it in to a power point. If you want to make custom changes to the lower or upper level settings, no problem. Instructions are included on how to customize these settings to suit your exact requirements and typically takes less than one minute to make changes.

The Model E device is 900mm wide, 750mm high and has a depth of 240mm and can store and lift a diverse range of typical garage storage items. As it typically stores items above head height it frees up space so you can walk right under it or open a car door up with ease.

With a galvanised or powder coated finish, it is adaptable to suit many typical situations within the garage or home environment where chemicals or solvents are used. The galvanised version is best suited to store harsh chemicals/solvents and can be fitted with or without a cover. Powder coated versions can still store chemicals and other similar products however more care needs to be taken when cleaning and selecting items to store.

Because things change, we designed Model E so that if you need to move it to a new location in the house or to a new house for example this can be done very simply with only the wall screws for brick, block or masonry requiring replacing.

The Model E is perfect for garages but can also be installed in suitable locations within the house such as laundries and corridors.

Proudly manufactured in Bendigo, Victoria & supporting Victorian businesses through the supply chain.

The Model-E range is available in 4 different variations to suit your specific needs and budget.

We are proud of our innovative design and features and hope you too will enjoy the benefits of Stow High for many years to come.
